Below is a concise A-to-Z plan to both understand the business and map out the systems you'll need to build.

***

1. Brand, positioning, and current state

- IG bio positions them as "your favorite chefs personal shopper - wholesaler - importer - purveyor," which is exactly the high-touch, chef-first lane you want to keep.[2]
- They have ~46K followers, 2.1K+ following, and ~220 posts, heavily featuring chef collabs, festivals (Eeeeeatscon, Coachella-style events, Hollywood Bowl, etc.), and restaurant dishes tagged with truffle/caviar.[3][4][5][6]
- They're clearly LA-centric and operate like a concierge: chefs DM/text the CEO, who then sources from Italy, Spain, Chile, Russia/China, Bulgaria, etc., for white and black truffles plus multiple sturgeon caviars and luxury accompaniments.[7][1]
- The PDF catalog shows they're effectively a specialty distributor with a very deep SKU set: fresh truffles, multiple caviar SKUs at different sizes and price points, butters, preserved truffle products, salumi, Wagyu, foie gras, cheeses, fish, spices, coffee, matcha, olive oils, and accessories.[1]

Implication: You're dealing with a full-line luxury foodservice importer with "concierge DNA" but zero systems. The key is to preserve the human, chef-centric feel while industrializing everything behind it.

***

2. Industry model: how comparable distributors operate

Look at Petrossian, Truffle Dealers, Savory Gourmet, and similar specialty importers:

- They present a very tight brand story around provenance, quality control, and chef partnerships, with clear categories for caviar, truffles, and "chef pantry" items.[8][9][10]
- Most have B2B wholesale programs with either:
  - An account-only ordering portal (login required) with contract pricing, or
  - A public e-commerce layer plus a wholesale onboarding form and rep-assigned accounts.[9][8]
- They operate on: distribution ERP (inventory + purchasing + fulfillment), CRM for chef accounts, and some flavor of account analytics: order history, top products, and spend.[10][9]

Key mechanics to mirror:

- Clear segmentation: Michelin/fine dining, hotels, high-end catering, gourmet retail.
- Tight control of fresh products (short seasons, pre-paid for ultra-rare white truffles, etc.), with higher minimums and tighter payment terms.[1]

- Strong storytelling around origin (Abruzzo white truffles, Russian/Bulgarian caviar, Japanese A5 Wagyu, etc.) to justify premium pricing.[9][1]

***

3. Target architecture: front end, portal, and data layer

Think of this as three layers:

1. **Public marketing site** (Brand + leadgen + pixels)
2. **Authenticated client portal** (ordering + credit terms + analytics)
3. **Internal ops layer** (CRM, inventory, payments, sales enablement)

3.1 Public marketing site

Goals: capture inbound interest, drive chefs to become accounts, and enable paid traffic.

Core sections:

- Home: “Always fresh, never frozen” value prop; hero showing truffle/caviar, social proof (Michelin-star logos, events like Eeeeeatscon, Hollywood Bowl, and collab restaurants), and clear “Apply for wholesale” CTA.[5][11][2][3]
- Product overview pages (not full wholesale pricing):
  - Truffles: seasonal calendar (Summer, Autumn/Burgundy, Winter/Perigord, White Abruzzese) with flavor notes and high-level pricing guidance (e.g., “market rate,” “pre-paid only”).[1]
  - Caviar: Kaluga, Osetra, Siberian, Russian Sturgeon, Beluga hybrid; tasting notes, sizes, use cases (caviar service, canapés, omelettes, etc.).[1]
  - “Chef pantry” (salumi, Wagyu, foie, oils, etc.) to position them as a one-stop source.[1]
- Wholesale application form: restaurant name, contact, service level, average covers, cuisine, city, tax/resale cert upload.
- Events & collabs: highlight festivals, hotel/restaurant partnerships to reinforce that they are **embedded** in the chef community.[6][3][5]
- Education: short “How to buy truffles/caviar for your menu” guides plus origin stories that can rank organically over time (SEO).[8][9][1]

Tech stack ideas:

- Build the marketing front end in **Next.js** (Vercel) or Webflow if they want in-house editing later.
- Integrations: Meta pixel, Google Ads tag, MeetCursive pixel, and analytics (GA4 or Plausible).[2]

3.2 Client ordering portal (B2B self-serve)

Goals: let 342+ accounts and new sign-ups order and reorder with zero CEO involvement.

Essential features (MVP):

- **Account login**: per-restaurant account with:
  - Account profile (billing, shipping, contacts, tax IDs).
  - Assigned sales rep & account manager.
- **Dynamic catalog** (sourced initially from the PDF):
  - Core categories: Fresh Truffles, Caviar, Truffle Butters, Preserved Truffles, Salumi, Pre-sliced Salumi, Seasonings, Oils, Wagyu, Foie Gras, “Pantry,” etc.[1]
  - Availability flags: “In season,” “Pre-order only,” “Limited,” “Out of stock,” matching the fresh truffle and fish seasonality.[1]
  - Customer-specific pricing lists (wholesale vs special rates).
- **Ordering UX**:
  - Add-to-order by weight/units (oz, lb, tins, cases) for items like truffles and caviar.[1]
  - Minimums enforced (e.g., 4–8 oz min on fresh truffles, 6 oz min on caviar).[1]
  - Delivery window selector and order notes (“service Tuesday; need by Monday 10am”).
- **Payment flows**:
  - Stripe for cards and ACH; use Stripe’s “Pay by bank,” or Plaid-enabled ACH to mimic Zelle/PayPal without fragmentation.
  - Wire instructions and “mark as paid” flow for large A5/Wagyu/caviar orders.[1]
  - Support for credit terms (Net 14, Net 30) for approved accounts.
- **Order status**:
  - Order confirmation, “in fulfillment,” “out for delivery,” “delivered.”
  - Downloadable invoices (PDF) with line items and TAX/fees.
- **Analytics for clients**:
  - Dashboard: total spend YTD, last 7 months, order frequency, top products, and average order value—mirroring the mockups you’ve already shown.
  - Export to CSV for chef’s accounting systems.

Implementation options:

- **Custom B2B portal** in Next.js + Supabase/Postgres + Stripe + Clerk/Auth0 for auth, deployed to Vercel.
- Or **headless** approach: Shopify Plus with a custom Next.js storefront; use Shopify B2B features for price lists and accounts.

Given the SKU complexity and need for tight control over fresh items, a custom Postgres schema may be cleaner than fighting Shopify’s B2B constraints.

***

4. Internal systems: CRM, ops, and sales team

4.1 Data model and “source of truth”

You want a single database that everything hangs off:

- **Accounts**: restaurants, hotels, caterers, retailers.
- **Contacts**: chef, GM, beverage director, owner.
- **Products**: normalized from the PDF (name, category, origin, pack size, unit of measure, wholesale price, retail/margin, seasonality, distributor/producer).[1]
- **Orders**: line items + payment status + fulfillment status.
- **Shipments**: link to orders, carrier/driver, delivery timestamps.
- **Sales activities**: calls, emails, DMs (summarized), meetings.

This can live in:

- A proper CRM with open APIs (HubSpot, Pipedrive, or Close) + a separate inventory/ops DB, or
- A custom Postgres + lightweight admin panel (e.g., Retool or a custom “Backoffice” Next.js app).

Given your automation skills, a **hybrid** is ideal: CRM for pipelines, admin panel for ops.

4.2 CRM and sales enablement

Goals: make the 22-rep team trackable, coachable, and scalable.

- **CRM setup**:
  - Import the 342+ accounts as organizations with associated contacts and current spend estimates.
  - Define pipelines: “New Restaurant,” “Reactivation,” “Upsell Caviar,” “Event/Collab.”
  - Set SLAs: new inbound chef enquiry contacted within X hours.
- **Call recording and intelligence**:
  - Use a platform like Gong, Attention, or Clari Copilot that:
    - Records and transcribes sales calls.
    - Pushes call summaries and next steps into the CRM automatically.
  - For reps who mostly call from cell phones, route through VoIP numbers (Twilio-based app or Aircall/CloudTalk) so every call is recorded and tied to an account.
- **Messaging unification**:
  - Central WhatsApp/Signal/IG DM numbers/accounts that can be shared by the team vs everyone using personal phones.[2]
  - Use an inbox tool that unifies SMS, WhatsApp, IG DM, and email, then syncs into CRM (e.g., Gorgias-style, or a custom Layer using APIs).

4.3 Inventory, purchasing, and logistics

From the catalog you can see they carry highly perishable and imported products, so you need basic ERP-lite.[1]

Minimum viable inventory system:

- Stock levels and allocations by DC (multiple distribution centers, plus cold storage).
- Purchase orders to suppliers (Italian truffle hunters, caviar farms in Russia/China/Bulgaria, Wagyu suppliers in Japan, etc.).[1]
- Forecasting: weekly/seasonal demand based on historical restaurant orders + event calendars.
- Expiry tracking for fresh caviar and frozen/foie items.[1]

You could:

- Start with a mid-market inventory app (Cin7, Dear/Unleashed, or Odoo modules), integrated with your main DB.
- Or build a slim inventory module in your backoffice app and expand over time.

Logistics:

- Standardize on route planning by driver (e.g., Routific, Onfleet) and link deliveries to order IDs.
- Record proof of delivery (photo/signature) in the system.

***

5. Automation to pull the CEO off his phone

Map every current CEO activity and design automations:

5.1 Inbound from Instagram and social

- Connect IG DM to an AI concierge:
  - Use an API-based DM tool; build a GPT-style agent that:
    - Greets, asks whether they are a chef/restaurant vs consumer.[2]
    - Qualifies: city, restaurant name, what they're buying (truffles, caviar, Wagyu, etc.), approximate volumes.
    - Either sends them a link to create a wholesale account or routes to a human for high-value opportunities.
- Auto-log DM conversations as leads in the CRM, tagged "Instagram."

5.2 Account management

- Automated reorder prompts:
  - For each account, track typical order frequency; if they lapse beyond a threshold, trigger:

  - Personalized email from rep, and
  - IG DM/SMS follow-up if no response.
- Menu-change triggers:
  - Use outbound campaigns to chef accounts when new seasonal products arrive (e.g., “White Abruzzese is in for the next 2 weeks; limited pre-paid stock”).[1]

5.3 Payments consolidation

Replace PayPal / Zelle / CashApp sprawl:

- Centralize payments into Stripe + ACH; create payment links and saved payment methods per account.
- For legacy clients who **insist** on wire or check, create a finance inbox and manual “mark as paid” flows—but keep everything reconciled in one ledger.

5.4 Internal reporting and dashboards

For the CEO, design:

- Daily briefing: new orders, cash collected, accounts at risk, and win/loss highlights from the sales team.
- Weekly view: top products, GM by category, new account activations, and event-driven revenue.
- Multi-DC inventory view: what’s on hand, what’s inbound, what’s aging.[1]

These map almost 1:1 with the dashboards you mocked (Total Spend, Total Orders, Avg Order Value, Monthly Revenue, Top Products, etc.).

***

6. Go-to-market: leverage their social graph and SEO

6.1 Paid and organic acquisition

- **Pixel + paid ads**:
  - Install Meta + Google pixels on all pages, especially the wholesale application and contact pages.
  - Start with retargeting campaigns to site visitors and IG engagers, promoting:
    - A “chef welcome kit” (discounted sampler of truffles/caviar/butter) and
    - Seasonal drops (white truffle, Perigord season, Beluga hybrid, Wagyu promotions).[1]
- **SEO and content**:
  - Create cornerstone pages: “How to buy fresh truffles in Los Angeles,” “Kaluga vs Osetra caviar,” “What is malossol caviar?” etc.[8][9][1]

  - Publish case studies of hotel/restaurant partnerships and festivals (with their partners' permission).[3][5][6]

6.2 Outbound and account-based

- Scrape and enrich lists of:
  - Fine dining and upscale casual restaurants, hotel F&B, private clubs, and high-end catering in target metros.
- Segment by:
  - Cuisine, check size, existing caviar/truffle usage (where you can see from menus), and chain vs independent.
- Use Clay to enrich and then run outbound sequences:
  - Email + phone + IG DM (for chefs who are very active socially).
  - Offer a "menu upgrade consult" + sample kit at a low introductory price or free with commitment.

MeetCursive usage:

- Drop their pixel on the site to identify anonymous visitors and build ICP-matched lead lists based on traffic from restaurant groups, hotels, etc., and feed those into outbound sequences.

***

7. Phased implementation roadmap (practical for you)

Phase 0 – Discovery & mapping (1–2 weeks)

- Interview CEO + a few top chefs to understand current flows, service expectations, and non-negotiables (e.g., "we always answer within 5 minutes").
- Map all current payment methods, logistics patterns, and DC workflows.
- Normalize the PDF catalog into a structured product table (you already have most of the fields from that doc).[1]

Phase 1 – Foundation (4–6 weeks)

- Launch v1 marketing site (using your V0 designs) with basic product overview pages and wholesale application.
- Choose CRM and sales-intel stack (e.g., HubSpot + Aircall + Gong/Attention).
- Import accounts and start enforcing all calls through tracked numbers.
- Implement Stripe for centralized payments; create standard invoice templates.

Phase 2 – Client portal MVP (6–10 weeks)

- Build the authenticated B2B ordering portal with:

- Login, catalog, cart, checkout (Stripe), and order history.
- Onboard a pilot group (10–20 key accounts) and run it side-by-side with the legacy workflow to iron out UX issues.
- Add client analytics dashboards for these pilot accounts and for internal reporting.

Phase 3 – Automation + scale (ongoing)

- Roll out portal to all 342+ accounts and formally sunset “order via CEO DM/text” except for VIP edge cases.
- Turn on IG DM AI concierge and automate basic qualifying and routing.[2]
- Launch retargeting ads and outbound sequences to new markets.
- Expand the knowledge base: SOPs for sales reps, DC staff, finance, and marketing.

***

8. How to preserve their relationship-driven brand

Everything above is “industrialization,” but their moat is being **personal, social, and present** in chef culture.

Guardrails:

- Maintain a “VIP Hotline” channel (dedicated WhatsApp/Signal number) that routes into an on-call team, not just the CEO.
- Keep the tone of all automations sounding like the founder (pull phrasing from their IG captions).[2]
- Use the portal to *augment* relationships (easy reorders, clear invoices, menu analytics) rather than replace conversations about menus, events, and collabs.

If you’d like, next step I can:

- Propose a concrete tech stack (exact SaaS tools + custom components) with pros/cons, and
- Turn your mockups into a detailed product requirements doc (field-level, table-level) so you can start building immediately.

Here’s a concrete, end-to-end tech stack with deep feature ideas, optimized for: B2B wholesale, high-touch relationships, and heavy automation.

***

1. Overall architecture

Use a **modular, API-first stack** with one data backbone (Postgres) and everything else plugged in via services.[1][2]

- Core data: Postgres (Supabase or managed Cloud SQL) as source of truth for accounts, products, orders, inventory snapshots.[2]
- Integration layer: n8n/Make or custom Node workers for syncing CRM, payments, inventory, and marketing tools.[1][2]

- Services:
  - Web/portal: Next.js + React + Tailwind.[3]
  - Auth & orgs: Clerk/Auth0 for multi-user “organizations” (restaurants, hotels).[4]
  - Payments: Stripe for cards + ACH + wire instructions.[5][6]
  - CRM: HubSpot or Pipedrive.
  - Sales intelligence: Gong or Attention.[7][8]
  - Inventory/ERP-lite: Odoo or Cin7/DEAR, or custom module.[9][10]
  - Product data: lightweight PIM layer (custom) with ideas borrowed from PIM best practices.[11]

***

2. Marketing site stack + features

Stack

- **Frontend**: Next.js (App Router) + React, Tailwind CSS, ShadcnUI for clean components.[3]
- **CMS**: Sanity, Payload, or Storyblok to let them edit copy, images, and blog posts without dev.[3]
- **Hosting**: Vercel for speed and edge caching.
- **Analytics**: GA4 + Plausible or PostHog for event-level tracking.[1]
- **Pixels**: Meta, Google Ads, MeetCursive.

Feature ideas (deep)

- SEO-optimized product education pages:
  - “What is White Abruzzese truffle” with seasonality, tasting notes, and chef use cases.[12][13][14]
  - “Kaluga vs Osetra vs Beluga hybrid caviar” with side-by-side tables.[14][12]
- Dynamic seasonal calendar:
  - Visual calendar component pulling from product metadata (`season_start`, `season_end`) to highlight which truffles/fish are “in season,” “pre-order,” or “off season.”[11][12]
- Wholesale application flow:
  - Multi-step form (business details, licenses, cuisine, average check size, order volume).
  - Auto-create CRM record + “New account review” task for sales.[15]
  - Optional “instant approval” tier for smaller accounts (e-commerce pricing) vs “custom pricing” for serious buyers.
- Event & collab hub:
  - A page where they can showcase festivals (Eeeeeatscon, hotel pop-ups, brand collabs) with photos, IG embeds, and contact button “Book us for your event.”[16][17]
- Content & PR library:
  - Blog posts, press mentions, podcast episodes, chef interviews, all structured for backlinking and SEO authority.[18][2]

***

3. Client portal (B2B ordering) stack + features

Stack

- **Next.js** app, sharing components/design with marketing site but separate auth.[3]
- **Auth & orgs**: Clerk or Auth0 Organizations, so each “restaurant” is an org with multiple user accounts (chef, GM, AP, beverage).[4]
- **Database**: Supabase or direct Postgres for orders, accounts, pricing tables, etc.[2]
- **Payments**: Stripe:
  - One-off invoices, card on file, ACH, and bank transfers.[6][5]
  - Payment links for legacy clients.
- **File storage**: Supabase storage / S3 for invoices, tax forms, documents.

Core B2B features (deep)

1. **Account model**

- Entities:
  - `Organization` (restaurant/hotel group)
  - `Location` (each venue, with its own shipping window)
  - `User` (roles: Admin, Chef, GM, AP, Rep)
- Permissions:
  - Chef can place orders, view recent invoices.
  - AP can view full history, pay invoices, manage payment methods.
  - GM/Owner can view analytics and approve credit terms.

2. **Catalog & pricing**

- Product attributes:
  - Category, origin, season, case pack, unit of measure, minimum order, storage (chilled/frozen/ambient), lead time, supplier.[12][11]
  - Flags: “Chef special,” “Limited,” “Market price (call).”[12]
- Buyer-specific catalogs:
  - Use PIM-style segmentation: only show SKUs relevant to their cuisine or region, and hide items like niche spices if not needed.[11]
  - Custom price list per account or tier (Gold, Platinum, etc.).[11]
- Dynamic unit conversions:
  - Show both per-oz/per-lb pricing and case pricing for things like salumi, Wagyu, and oils.[12][11]

3. **Ordering UX**

- Quick order grid:
  - Spreadsheet-like interface where chefs can tab through lines, enter quantities, and see live totals and min order warnings.
- “Repeat last order” + “Chef favorites”:
  - Buttons to reorder the same basket as last Tuesday or from a saved template (“Tasting menu truffle/caviar setup”).
- Substitutions logic:
  - If White Abruzzese is unavailable, suggest Winter Black Perigord or preserved products with margin notes.[12]
- Delivery scheduling:
  - Preferred delivery days per location, with time windows.
  - Soft rules (charge fee or require minimum for off-route delivery).[10]

4. **Payments & terms**

- Stripe-based flows:
  - Pay at checkout (card/ACH) for COD accounts.[5]
  - “Place order on terms” for approved Net-14/30 clients; invoices auto-generated and synced to accounting.[4][5]
- Credit and collections:
  - Track open balance per account, credit limit, days beyond terms.
  - Automated reminders: 3 days before due, on due date, 7 days after.

5. **Client analytics**

- Dashboard for each org:
  - Total spend YTD, last 12 months, order frequency, average order value.
  - Top products and categories, e.g., “44% of spend: truffles, 27%: caviar.”[11][12]
  - Seasonality chart: when they spend most and on what.
- Operational metrics:
  - “On-time delivery rate” to that account, refused orders, issues log.

***

4. Internal ops + inventory stack

Inventory & purchasing

Because SKUs are complex (multi-UOM, seasonal, perishable), bring in principles from food-distribution PIM/ERP tooling.[9][10][11]

Options:

1. **Mid-market ERP/inventory**:

  - Odoo (Inventory + Purchase + Accounting modules).[9]
  - DEAR/Unleashed or Cin7 for wholesale distribution.[10]
  - Pros: ready-made purchase orders, landed cost, batch/lot tracking, multi-warehouse.
2. **Custom “ERP-lite”** (in your backoffice app) if they want something leaner first.

Key features to implement whichever way:

- Multi-warehouse inventory:
  - Each DC (LA, any other city), plus virtual warehouses for “in transit” shipments from suppliers.[10]
- Expiry and batch tracking:
  - Lot numbers on caviar and fresh/frozen items with expiry, so you can do FEFO (first-expiry, first-out).[12]
- Purchasing workflow:
  - Forecast demand by product based on last 8–12 weeks of orders + known seasonal spikes.[2][10]
  - Create POs to truffle hunters, caviar farms, and Wagyu suppliers with expected arrival dates.[12]
- Cost & margin analytics:
  - Track landed cost (product + freight + duties) for imports and show gross margin per SKU and per account.[2][9]

Backoffice/admin app

A separate “Admin” interface (Next.js or Retool):

- Order operations:
  - Ops view of “Today’s orders by route,” with status changes and notes.
- Price management:
  - Edit base cost, markup, and client-specific overrides.
- Account management:
  - Approve new wholesale applications, set credit limits, assign reps.
- Exception handling:
  - Replace items, apply credits, issue refunds, and log issues (“product quality complaint,” “late delivery”).

***

5. CRM, sales stack, and call intelligence

CRM

Pick **HubSpot** or **Pipedrive** as the central “revenue system.”

Features to wire up:[15]

- Objects:
  - Companies (accounts), Contacts, Deals (new account, upsell, reactivation), Tickets (service issues).
- Integration flows:
  - New wholesale app → create Company + Contact + Deal “New Account.”
  - Portal orders → log as Deals or revenue activities on the account timeline.
- Playbooks:
  - Standard sequences for new restaurant onboarding, account expansion, and reactivation of dormant accounts.

Call recording & coaching

Use Gong or Attention as the “brain” for the 22-rep team.[8][7]

Core features to leverage:

- Automatic capture:
  - Record 100% of sales calls and key account conversations via VoIP (Aircall/CloudTalk/Twilio-based system).[7]
  - Auto-log emails and calendar meetings from G Suite/O365.[7]
- AI conversation analysis:
  - Topic tagging: menu design, pricing, delivery issues, competitors.[19][7]
  - Sentiment/engagement: talk–listen ratio, monologues, question rate.[7]
- Coaching & enablement:
  - Smart playlists: “Top deals won,” “Calls mentioning white truffle,” “Calls where shipping was an issue.”[8][7]
  - Scorecards for reps, plus specific feedback on discovery questions, positioning, and upsell patterns.[7]
- Deal and pipeline insights:
  - Gong board for “At-risk” deals (no next step, no multi-threading, price objections).[19][8]
  - Alerts to managers when a key account mentions switching suppliers, price hikes, or quality issues.[19]

You can also use their AI task-prioritization concepts to build your own simplified version (e.g., “call these 10 accounts first today; they just opened invoices and visited the portal”).[19]

***

6. Messaging, DMs, and automation layer

Unified communications

Goal: move from “CEO’s phone” to a shared, trackable inbox.

Stack options:

- **Front/Gorgias-style shared inbox** for email + SMS + WhatsApp + IG DMs.
- Or custom Node/Next.js “Comms Hub” using:
  - Twilio for SMS/WhatsApp,
  - Meta API for IG DMs,
  - Simple UI for reps to respond with routing rules.

Features:

- All inbound messages are:
  - Identified (mapping phone/handle to an account),
  - Logged to CRM as activities,
  - Assigned to owner (rep).
- SLA tracking:
  - Time to first response metrics, with alerts for VIP accounts exceeding thresholds.

AI concierge for IG DMs and site chat

Use OpenAI-style models wrapped in your own logic.

Capabilities:

- Qualification:
  - Ask if they are a chef/restaurant/consumer, where they’re located, and what they’re looking for.
- Self-serve answers:
  - Use knowledge base (product FAQ, seasonality, pricing rules) to answer common questions.[11]
- Routing:
  - Hand off to human when deals are high value, or after a certain depth (“let me connect you with Brandon to finalize details”).
- Lead capture:
  - Push structured leads into CRM with tags (“IG inbound – caviar interest – NYC”).

***

7. Data/analytics stack

Infrastructure

- **Data warehouse**: BigQuery or Snowflake for long-term data (orders, inventory, CRM, web events).[2]
- **ETL**: Airbyte/Fivetran or your own n8n workers to sync from:
  - Postgres, Stripe, CRM, Gong, web analytics, ad platforms.[1][2]
- **BI**: Metabase, Lightdash, or Looker Studio for dashboards.

Dashboards

Internal:

- CEO view:
  - Revenue by week/month, gross margin by category, top 50 accounts, churn, pipeline.[10][2]
- Ops view:
  - Fill rate, stockouts, spoilage, on-time delivery rate, lead times by supplier.[10]
- Sales view:
  - Rep performance, call volume, meeting volume, win rates, average deal cycle.[8][7]

Client-facing (in portal):

- “Your performance”:
  - YTD spend, category mix, average order size, suggested optimizations (“You’re ordering 12 small tins; consider upsizing to 500g tins for better cost per gram”).[11]

***

8. Product information / catalog management (PIM-lite)

Borrow from B2B PIM best practices.[11]

Features:

- Supplier feed ingestion:
  - Import CSV/Excel from truffle suppliers, caviar farms, salumi producers, etc., and map to internal schema.[11]
- Attribute normalization:
  - Standardize pack sizes, UOM, certifications, and dietary tags.[11]
- Catalog segmentation:
  - Build “views” by vertical (fine-dining, hotels, retail) and region.[11]
- Channel syndication:
  - Push enriched product data to:
    - Portal API,
    - PDF price lists,
    - CRM for upsell prompts,
    - 3rd-party marketplaces if they ever list there.[11]

***

9. Knowledge base and SOPs

Finally, build a **knowledge base** that underpins AI and onboarding.

Stack:

- Notion or GitBook as main knowledge base.
- Connect to AI agents (site chat, DM concierge, internal “Ops Copilot”) with embeddings.

Content:

- Product sheets for each truffle/caviar SKU (origin, seasonality, handling, menu ideas).[12]
- SOPs for:
  - New account onboarding,
  - Ordering cutoff times per region,
  - Replacements/credits,
  - Event collaboration playbooks.

***

If you want, next step I can turn this into a phased implementation plan with specific “sprints” (e.g., Sprint 1: catalog ingestion + pricing; Sprint 2: auth + account model; Sprint 3: ordering flow; etc.), and map which pieces you build custom vs buy.
